★ 불 ▶ 불 ∽ ९ ○ 25.06.2012 3 / 54

<ロ> (日) (日) (日) (日) (日)

Reminder: Underlying Idea

Transfer the notion of contract between business partners to software engineering

What is a contract?

A binding agreement that explicitly states the **obligations** and the **benefits** of each partner

イロト 不得下 イヨト イヨト 二日

Example: Contract between Builder and Landowner

	Obligations	Benefits
Landowner	Provide 5 acres of	Get building in less
	land; pay for building	than six months
	if completed in time	
Builder	Build house on pro-	No need to do any-
	vided land in less than	thing if provided land
	six month	is smaller than 5 acres;
		Receive payment if
		house finished in time

(日) (四) (三) (三) (三)

Who are the contract partners in SE?

Partners can be modules/procedures, objects/methods, components/operations, ...

In terms of software architecture, the partners are the components and each connector may carry a contract.

▲□▶ ▲□▶ ▲□▶ ▲□▶ = ののの

Contracts for Procedural Programs

- Goal: Specification of imperative procedures
- Approach: give assertions about the procedure
 - Precondition
 - must be true on entry
 - ensured by caller of procedure
 - Postcondition
 - must be true on exit
 - ensured by procedure if it terminates
- ▶ Precondition(State) ⇒ Postcondition(procedure(State))
- Notation: {Precondition} procedure {Postcondition}
- Assertions stated in first-order predicate logic

Peter Thiemann (Univ. Freiburg)

Softwaretechnik

25.06.2012 7 / 54

Example

Consider the following procedure:

```
/**
 * Oparam a an integer
 * @returns integer square root of a
 */
int root (int a) {
  int i = 0;
  int k = 1;
  int sum = 1;
  while (sum \leq = a) {
    k = k+2:
    i = i+1;
    sum = sum+k;
  return i;
```

Peter Thiemann (Univ. Freiburg)

<ロ> (日) (日) (日) (日) (日)

Specification of root

- ▶ types guaranteed by compiler: a ∈ integer and root ∈ integer (the result)
- 1. root as a partial function Precondition: $a \ge 0$ Postcondition: root * root $\le a < (root + 1) * (root + 1)$
- root as a total function Precondition: true Postcondition:

$$\begin{array}{rl} (\mathtt{a} \geq \mathtt{0} & \Rightarrow & \mathtt{root} * \mathtt{root} \leq \mathtt{a} < (\mathtt{root} + 1) * (\mathtt{root} + 1) \\ \wedge \\ (\mathtt{a} < \mathtt{0} & \Rightarrow & \mathtt{root} = \mathtt{0}) \end{array}$$

Peter Thiemann (Univ. Freiburg)

イロト 不得 トイヨト イヨト 二日

Weakness and Strength

Goal:

- find weakest precondition

 a precondition that is implied by all other preconditions
 highest demand on procedure
 largest domain of procedure
 (Q: what if precondition = false?)
- find strongest postcondition

 a postcondition that implies all other postconditions
 smallest range of procedure
 (Q: what if postcondition = true?)

Met by "root as a total function":

- true is weakest possible precondition
- "defensive programming"

イロト 不得下 イヨト イヨト 二日

Example (Weakness and Strength)

Consider root as a function over integers Precondition: **true**

Postcondition:

$$\begin{array}{ll} (\texttt{a} \geq \texttt{0} & \Rightarrow & \texttt{root} * \texttt{root} \leq \texttt{a} < (\texttt{root} + 1) * (\texttt{root} + 1)) \\ \land \\ (\texttt{a} < \texttt{0} & \Rightarrow & \texttt{root} = \texttt{0}) \end{array}$$

- true is the weakest precondition
- The postcondition can be strengthened to

$$\begin{array}{lll} (\texttt{root} \geq \texttt{0}) & \land \\ (\texttt{a} \geq \texttt{0} & \Rightarrow & \texttt{root} * \texttt{root} \leq \texttt{a} < (\texttt{root} + 1) * (\texttt{root} + 1)) & \land \\ (\texttt{a} < \texttt{0} & \Rightarrow & \texttt{root} = \texttt{0}) \end{array}$$

Peter Thiemann (Univ. Freiburg)

25.06.2012 11 / 54

イロト 不得 トイヨト イヨト 二日

An Example

Insert an element in a table of fixed size

```
class TABLE<T> {
    int capacity; // size of table
    int count; // number of elements in table
    T get (String key) {...}
    void put (T element, String key);
}
```

Precondition: table is not full

```
count < capacity
```

Postcondition: new element in table, count updated

```
\texttt{count} \leq \texttt{capacity}
 \land \texttt{get}(\texttt{key}) = \texttt{element}
 \land \texttt{count} = \texttt{old} \texttt{count} + 1
```

Peter Thiemann (Univ. Freiburg)

25.06.2012 12 / 54

	Obligations	Benefits
Caller	Call put only on	Get modified table
	non-full table	in which element
		is associated with
		key
Procedure	Insert element in	No need to deal
	table so that it	with the case
	may be retrieved	where table is full
	through key	before insertion

Design by Contract Contracts for Object-Oriented Programs

Contracts for Object-Oriented Programs

Peter Thiemann (Univ. Freiburg)

Softwaretechnik

■ ▶ ▲ ■ ▶ ■ ∽ Q C 25.06.2012 14 / 54

イロト イポト イヨト イヨト

Contracts for Object-Oriented Programs

Contracts for methods have additional complications

- local state receiving object's state must be specified
- inheritance and dynamic method dispatch receiving object's type may be different than statically expected; method may be overridden

イロト 不得下 イヨト イヨト 二日

Local State \Rightarrow Class Invariant

- class invariant INV is predicate that holds for all objects of the class
- \Rightarrow must be established by all constructors
- $\Rightarrow\,$ must be maintained by all visible methods

イロト 不得 トイヨト イヨト 二日

Pre- and Postconditions for Methods

constructor methods c

 $\{\mathbf{Pre}_c\} \ c \ \{INV\}$

visible methods m

 $\{\operatorname{Pre}_m \land INV\} \ m \ \{\operatorname{Post}_m \land INV\}$

Peter Thiemann (Univ. Freiburg)

Softwaretechnik

25.06.2012 17 / 54

▲□▶ ▲□▶ ▲□▶ ▲□▶ = ののの

Table example revisited

- count and capacity are instance variables of class TABLE
- INV_{TABLE} is count \leq capacity
- > specification of void put (T element, String key)
 Precondition:

count < capacity

Postcondition:

 $\texttt{get}(\texttt{key}) = \texttt{element} \land \texttt{count} = \texttt{old} \texttt{ count} + 1$

Peter Thiemann (Univ. Freiburg)

25.06.2012 18 / 54

Inheritance and Dynamic Binding

- Subclass may override a method definition
- Effect on specification:
 - Subclass may have different invariant
 - Redefined methods may
 - have different pre- and postconditions
 - raise different exceptions
 - \Rightarrow method specialization
- Relation to invariant and pre-, postconditions in base class?
- Guideline: No surprises requirement (Wing, FMOODS 1997) Properties that users rely on to hold of an object of type T should hold even if the object is actually a member of a subtype S of T.

Peter Thiemann (Univ. Freiburg)

Softwaretechnik

25.06.2012 19 / 54

イロト 不得 トイヨト イヨト

Invariant of a Subclass

Suppose

class MYTABLE extends TABLE ...

- each property expected of a TABLE object should also be granted by a MYTABLE object
- ▶ if o has type MYTABLE then *INV*_{TABLE} must hold for o
- \Rightarrow *INV*_{MYTABLE} \Rightarrow *INV*_{TABLE}
 - Example: MYTABLE might be a hash table with invariant

```
INV_{MYTABLE} \equiv \texttt{count} \leq \texttt{capacity}/3
```

Peter Thiemann (Univ. Freiburg)

25.06.2012 20 / 54

▲□▶ ▲□▶ ▲□▶ ▲□▶ = ののの

Method Specialization

If MYTABLE redefines put then ...

- the new precondition must be weaker and
- the new postcondition must be stronger

because in

```
TABLE cast = new MYTABLE (150);
```

• • •

cast.put (new Terminator (3), "Arnie");

the caller

- only guaranties Pre_{put,Table}
- and expects Post_{put,Table}

Peter Thiemann (Univ. Freiburg)

Requirements for Method Specialization

Suppose class T defines method m with assertions $\operatorname{Pre}_{T,m}$ and $\operatorname{Post}_{T,m}$ throwing exceptions $\operatorname{Exc}_{T,m}$. If class S extends class T and redefines m then the redefinition is a sound method specialization if

- $\mathbf{Pre}_{\mathcal{T},m} \Rightarrow \mathbf{Pre}_{\mathcal{S},m}$ and
- $\mathbf{Post}_{S,m} \Rightarrow \mathbf{Post}_{T,m}$ and
- ► Exc_{S,m} ⊆ Exc_{T,m} each exception thrown by S.m may also be thrown by T.m

▲□▶ ▲□▶ ▲□▶ ▲□▶ = ののの

Example: MYTABLE.put

- Pre_{MYTABLE,put} = count < capacity/3 not a sound method specialization because it is not implied by count < capacity.</p>
- ► MYTABLE may automatically resize the table, so that Pre_{MYTABLE,put} ≡ true a sound method specialization because count < capacity ⇒ true!</p>
- Suppose MYTABLE adds a new instance variable T lastInserted that holds the last value inserted into the table.

is sound method specialization because $Post_{MYTABLE,put} \Rightarrow Post_{TABLE,insert}$

Peter Thiemann (Univ. Freiburg)

Softwaretechnik

25.06.2012 23 / 54

Interlude: Method Specialization in Java 5

- Overriding methods in Java 5 only allows specialization of the result type. (It can be replaced by a subtype).
- The parameter types muss stay unchanged (why?)

Example : Assume A extends B

```
class C {
    A m () {
        return new A();
    }
}
class D extends C {
    B m () { // overrides method C.m()
        return new B();
    }
}
```

イロト イポト イヨト イヨト

Design by Contract Contract Monitoring

Contract Monitoring

Peter Thiemann (Univ. Freiburg)

Softwaretechnik

■ ト 4 ■ ト ■ つへで 25.06.2012 25 / 54

・ロト ・四ト ・ヨト ・ヨト

Contract Monitoring

- What happens if a system's execution violates an assertion at run time?
- A violating execution runs outside the system's specification.
- The system's reaction may be arbitrary
 - crash
 - continue

イロト 不得下 イヨト イヨト 二日

Contract Monitoring

- What happens if a system's execution violates an assertion at run time?
- A violating execution runs outside the system's specification.
- The system's reaction may be arbitrary
 - crash
 - continue

Contract Monitoring

- evaluates assertions at run time
- raises an exception indicating any violation
- assign blame for the violation

Contract Monitoring

- What happens if a system's execution violates an assertion at run time?
- A violating execution runs outside the system's specification.
- The system's reaction may be arbitrary
 - crash
 - continue

Contract Monitoring

- evaluates assertions at run time
- raises an exception indicating any violation
- assign blame for the violation

Why monitor?

- Debugging (with different levels of monitoring)
- ► Software fault tolerance (*e.g.*, α and β releases)

Peter Thiemann (Univ. Freiburg)

Softwaretechnik

25.06.2012 26 / 54

What can go wrong

precondition: evaluate assertion on entry identifies problem in the caller postcondition: evaluate assertion on exit identifies problem in the callee invariant: evaluate assertion on entry and exit problem in the callee's class hierarchy: unsound method specialization need to check (for all superclasses T of S) • $\mathbf{Pre}_{T,m} \Rightarrow \mathbf{Pre}_{S,m}$ on entry and • **Post**_{S.m} \Rightarrow **Post**_{T.m} on exit

how?

Peter Thiemann (Univ. Freiburg)

25.06.2012 27 / 54

▲□▶ ▲□▶ ▲□▶ ▲□▶ = ののの

Hierarchy Checking

Suppose class S extends T and overrides a method m. Let T = new S() and consider x.m()

- on entry
 - if $\mathbf{Pre}_{T,m}$ holds, then $\mathbf{Pre}_{S,m}$ must hold, too
 - Pre_{S,m} must hold
- on exit
 - Post_{S,m} must hold
 - if $Post_{S,m}$ holds, then $Post_{T,m}$ must hold, too
- in general: cascade of implications between S and T
- pre- and postcondition only checked for S!
- ▶ If the precondition of *S* is not fulfilled, but the one of *T* is, then this is a wrong method specialization.

▲□▶ ▲□▶ ▲□▶ ▲□▶ = ののの

Examples

```
interface IConsole {
    int getMaxSize();
    @post { getMaxSize > 0 }
    void display (String s);
    @pre { s.length () < this.getMaxSize() }
}
class Console implements IConsole {
    int getMaxSize () { ... }
    @post { getMaxSize > 0 }
    void display (String s) { ... }
    @pre { s.length () < this.getMaxSize() }
}</pre>
```

Peter Thiemann (Univ. Freiburg)

25.06.2012 29 / 54

イロト 不得下 イヨト イヨト 二日

A Good Extension

```
class RunningConsole extends Console {
    void display (String s) {
        ...
        super.display(String. substring (s, ..., ... + getMaxSize()))
        ...
    }
    @pre { true }
}
```

Peter Thiemann (Univ. Freiburg)

25.06.2012 30 / 54

イロト 不得 トイヨト イヨト 二日

A Bad Extension

```
class PrefixedConsole extends Console {
   String getPrefix() {
    return ">> ";
   }
   void display (String s) {
     super.display (this.getPrefix() + s);
   }
   @pre { s.length() < this.getMaxSize() - this.getPrefix().length() }
}</pre>
```

- caller may only guarantee IConsole's precondition
- Console.display can be called with to long argument
- blame the programmer of PrefixedConsole!

Peter Thiemann (Univ. Freiburg)

Properties of Monitoring

- Assertions can be arbitrary side effect-free boolean expressions
- Instrumentation for monitoring can be generated from the assertions
- Monitoring can only prove the presence of violations, not their absence
- Absence of violations can only be guaranteed by formal verification

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Proving a Hoare triple

$\{P\} \subset \{Q\}$

- holds if (∀σ ∈ State) P(σ) ⇒ (Q(S[[C]]σ) ∨ S[[C]]σ = ⊥) (partial correctness)
- ▶ alternative reading/notation: $P, Q \subseteq State$ {P} C {Q} $\equiv S[[C]]P \subseteq Q \cup \bot$
- ► reading predicates as boolean expressions $\mathcal{B}\llbracket P \rrbracket \sigma = \texttt{true} \Rightarrow (\mathcal{B}\llbracket Q \rrbracket (\mathcal{S}\llbracket C \rrbracket \sigma) = \texttt{true} \lor \mathcal{S}\llbracket C \rrbracket \sigma = \bot)$

Peter Thiemann (Univ. Freiburg)

25.06.2012 39 / 54

イロト 不得下 イヨト イヨト 二日

Proof Rules for Hoare Triples

- ▶ Proving that $\{P\} \in \{Q\}$ holds directly from the definition is tedious
- Instead: define axioms and inferences rules
- Construct a derivation to prove the triple
- Choice of axioms and rules guided by structure of C

Peter Thiemann (Univ. Freiburg)

Softwaretechnik

25.06.2012 40 / 54

イロト 不得下 イヨト イヨト 二日

Skip Axiom

$\{P\} \text{ skip } \{P\}$

Peter Thiemann (Univ. Freiburg)

Softwaretechnik

25.06.2012 41 / 54

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Skip Axiom

$\{P\}$ skip $\{P\}$

Correctness

- $\blacktriangleright \ \mathcal{S}[\![\texttt{skip}]\!]\sigma = \sigma$
- $\blacktriangleright \ \mathcal{S}[\![\texttt{skip}]\!] P = P$

Peter Thiemann (Univ. Freiburg)

◆□▶ ◆□▶ ◆ □▶ ◆ □▶ ● □ ● ● ● ●

Assignment Axiom

$$\{P[x \mapsto E]\} \ x = E \ \{P\}$$

Examples:

- $\{1 == 1\} x = 1 \{x == 1\}$
- $\{odd(1)\} x = 1 \{odd(x)\}$
- {x == 2 * y + 1} y = 2 * y {x == y + 1}

Peter Thiemann (Univ. Freiburg)

25.06.2012 42 / 54

Assignment Axiom — Correctness

$$\{P[x\mapsto E]\}\ x=E\ \{P\}$$

- Semantics $S[x=E]\sigma = \sigma[x \mapsto \mathcal{E}[E]\sigma]$
- ► Have to show $\mathcal{B}[\![P[x \mapsto E]]\!]\sigma = \texttt{true} \Rightarrow$ $(\mathcal{B}[\![P]](\mathcal{S}[\![x = E]\!]\sigma) = \texttt{true} \lor \mathcal{S}[\![x = E]\!]\sigma = \bot)$
- By induction on P; result of B[[E'ρE"]]σ must remain the same; result of E[[E']]σ must remain the same
- Sufficient to show $\mathcal{E}\llbracket E'[x \mapsto E] \rrbracket \sigma = \mathcal{E}\llbracket E' \rrbracket \sigma[x \mapsto \mathcal{E}\llbracket E \rrbracket \sigma]$
- ► Holds because $\mathcal{E}[\![x[x \mapsto E]\!]]\sigma = \mathcal{E}[\![E]\!]\sigma = \mathcal{E}[\![x]\!]\sigma[x \mapsto \mathcal{E}[\![E]\!]\sigma]$

Peter Thiemann (Univ. Freiburg)

25.06.2012 43 / 54

Sequence Rule

$$\frac{\{P\} C \{R\} \{R\} D \{Q\}}{\{P\} C; D \{Q\}}$$

Example:

Peter Thiemann (Univ. Freiburg)

Softwaretechnik

25.06.2012 44 / 54

◆□> ◆圖> ◆臣> ◆臣> □臣

Sequence Rule

$$\frac{\{P\} C \{R\} \{R\} D \{Q\}}{\{P\} C; D \{Q\}}$$

Example:

$$\begin{array}{c} \{x == 2 * y + 1\} \ y = 2 * y \ \{x == y + 1\} \\ \{x == 2 * y + 1\} \ y = 2 * y; y = y + 1 \ \{x == y\} \end{array}$$

Correctness

• If
$$\sigma \in P$$
 then $\sigma' = S[[C]]\sigma \in R \cup \{\bot\}$

- ▶ If $\sigma' = \bot$ then $S[\![D]\!] \bot = \bot$
- If $\sigma' \in R$ then $S[\![D]\!]\sigma' \in Q \cup \{\bot\}$
- Hence: $\sigma \in P \Rightarrow S[\![C; D]\!] \sigma \in Q \cup \{\bot\}$

Peter Thiemann (Univ. Freiburg)

25.06.2012 44 / 54

Conditional Rule — Issues

Examples:

_

$$\begin{array}{ll} \{P \wedge x < 0\} \ z = -x \ \{z == |x|\} & \{P \wedge x \geq 0\} \ z = x \ \{z == |x|\} \\ \hline \{P\} \ \text{if } x < 0 \ \text{then } z = -x \ \text{else } z = x \ \{z == |x|\} \end{array}$$

- incomplete!
- ▶ precondition for z = -x should be $(z == |x|)[z \mapsto -x] \equiv -x == |x|$
- \Rightarrow need logical rules

Logical Rules

weaken precondition

$$\frac{P' \Rightarrow P \quad \{P\} \ C \ \{Q\}}{\{P'\} \ C \ \{Q\}}$$

strengthen postcondition

$$\frac{\{P\} C \{Q\} \qquad Q \Rightarrow Q'}{\{P\} C \{Q'\}}$$

• Example needs strengthening: $P \land x < 0 \Rightarrow -x == |x|$

_

• holds if $P \equiv \mathbf{true}!$

• similarly:
$$P \land x \ge 0 \Rightarrow x == |x|$$

Peter Thiemann (Univ. Freiburg)

25.06.2012 47 / 54

Logical Rules

weaken precondition

$$\frac{P' \Rightarrow P \quad \{P\} \ C \ \{Q\}}{\{P'\} \ C \ \{Q\}}$$

strengthen postcondition

$$\frac{\{P\} C \{Q\} \qquad Q \Rightarrow Q'}{\{P\} C \{Q'\}}$$

- Example needs strengthening: $P \land x < 0 \Rightarrow -x == |x|$
- holds if $P \equiv \mathbf{true}!$

• similarly:
$$P \land x \ge 0 \Rightarrow x == |x|$$

Correctness $P' \Rightarrow P$ iff $P' \subseteq P$ (as set of states)

Peter Thiemann (Univ. Freiburg)

While Rule

$$\frac{\{P \land B\} C \{P\}}{\{P\} \text{ while } B \text{ do } C \{P \land \neg B\}}$$

P is loop invariant
 Example: try to prove

```
{ a>=0 /\ i==0 /\ k==1 /\ sum==1 }
while sum <= a do
    k = k+2;
    i = i+1;
    sum = sum+k
{ i*i <= a /\ a < (i+1)*(i+1) }</pre>
```

 \Rightarrow while rule not directly applicable ...

Peter Thiemann (Univ. Freiburg)

While Rule

Step 1: Find the loop invariant

- P ≡ i * i ≤ a ∧ i ≥ 0 ∧ k == 2 * i + 1 ∧ sum == (i + 1) * (i + 1) holds on entry to the loop
- ▶ To prove that *P* is an invariant, requires to prove that $\{P \land sum \le a\}$ k = k + 2; i = i + 1; sum = sum + k $\{P\}$
- It follows by the sequence rule and weakening:

Proof of loop invariance

```
{ i*i<=a /\ i>=0 /\ k==2*i+1 /\ sum==(i+1)*(i+1) /\ sum<=a }
{
            i \ge 0 /\ k+2==2+2*i+1 /\ sum==(i+1)*(i+1) /\ sum<=a }
k = k+2
{
                  ( k=2+2*i+1 )  sum==(i+1)*(i+1) / sum<=a }
            i>=0
{
            i+1>=1 / k==2*(i+1)+1 / sum==(i+1)*(i+1) / sum<=a 
i = i+1
Ł
            i > = 1 /\ k==2*i+1
                                   /\ sum==i*i
                                                       \land sum<=a }
\{ i * i <= a / \} i >= 1
                   / k = 2 + i + 1
                                   /\ sum+k==i*i+k
                                                       /  sum+k<=a+k }
sum = sum+k
{ i*i<=a /\ i>=1 /\ k==2*i+1
                                   /  sum==i*i+k /  sum<=a+k }
{ i*i<=a /\ i>=1 /\ k==2*i+1
                                   \land sum==i*i+2*i+1 \land sum<=a+k }
\{ i * i <= a / i >= 1 / k == 2 * i + 1 \}
                                   / sum == (i+1)*(i+1) / sum <= a+k 
{ i*i<=a /\ i>=0 /\ k==2*i+1
                                   / sum == (i+1)*(i+1)
```

Peter Thiemann (Univ. Freiburg)

25.06.2012 51 / 54

Step 2: Apply the while rule

$$\begin{array}{l} \{P \land sum \leq a\} \ k = k+2; i = i+1; sum = sum + k \ \{P\} \\ \hline \{P\} \ \text{while} \ sum \leq a \ \text{do} \ k = k+2; i = i+1; sum = sum + k \ \{P \land sum > a\} \end{array}$$

Now, $P \wedge sum > a$ is

{ i*i<=a /\ i>=0 /\ k==2*i+1 /\ sum==(i+1)*(i+1) /\ sum>a } implies

{ i*i<=a /\ a<(i+1)*(i+1) }

Correctness of While-Rule

$$\frac{\{P \land B\} \ C \ \{P\}}{\{P\} \text{ while } B \text{ do } C \ \{P \land \neg B\}}$$

- ► Consider $S[[while B \text{ do } C]]\sigma = F(\sigma)$ where $F(\sigma) = B[[B]]\sigma = \text{true} \to F(S[[C]]\sigma), \sigma$
- ► Case $\forall n \in \mathbb{N}$, $\mathcal{B}\llbracket B \rrbracket (\mathcal{S}\llbracket C \rrbracket^{(n)} \sigma) = \texttt{true:} \text{ set } F(\sigma) = \bot.$
- ▶ Case $\exists n \in \mathbb{N}$, $\mathcal{B}\llbracket B \rrbracket (\mathcal{S}\llbracket C \rrbracket^{(n)} \sigma) = \texttt{false}$: let n_0 be minimal

• Let
$$\sigma \in P = (P \land B) \uplus (P \land \neg B)$$

- Case $n_0 = 0$: $\sigma \in P \land \neg B$, then $F(\sigma) = \sigma \in P \land \neg B$. OK.
- ► Case $n_0 > 0$: $\sigma \in P \land B$, then $\sigma' = S[[C]]\sigma \in P \cup \{\bot\}$ by assumption. By induction, $F(\sigma') = S[[C]]^{(n_0-1)}\sigma' \in P \land \neg B \cup \{\bot\}$

Peter Thiemann (Univ. Freiburg)

Properties of Formal Verification

- requires more restrictions on assertions (e.g., use a certain logic) than monitoring
- full compliance of code with specification can be guaranteed
- scalability is a challenging research topic:
 - full automatization
 - manageable for small/medium examples
 - large examples require manual interaction
 - real programs use arrays and dynamic datastructures (pointers, objects)
